SIGNAL LOST

Inspired by the raw visual language of old television screens, underground music videos and early digital graphics, SIGNAL LOST explores the relationship between photography and digital distortion.

The original portraits were transformed through heavy red color grading, strong contrasts, scanlines and rough pixel textures. The intention was to make the images feel like frames captured from a damaged screen rather than traditional photographs.

The repetition of faces along the bottom creates a sense of rhythm and visual noise, while the oversized portrait remains the main focus. The result is a deliberately imperfect composition that combines music culture, digital experimentation and editorial design.

you can distort the image.
not the legacy
